

IN THE SPECIFICATION:

Please amend the title on page 1 as follows:

POXVIRUS VECTOR ENCODING RETROVIRUS (EG-HIV) AND
CYTOKINE

Please amend the paragraph beginning on page 14, beginning at line 26 as follows:

Anti-retroviral compounds act by a number of different [[of]]mechanisms which selectively affect the virus. For example, protease inhibitors, reverse transcriptase inhibitors and ribonucleotide reduction inhibitors may be employed or compounds which inhibit viral adsorption, assembly, integration and transcription. As will be known to those skilled in the art there are a large number of anti-retroviral compounds which may be administered. Examples of protease inhibitors include Indinavir and Nelfinavir. Reverse transcriptase inhibitors include, for example, Zidovisidine, Stavudine and Didanosine. Examples of ribonucleotide reductase inhibitors include thiosemicarbazone derivatives.

Please amend the paragraph beginning on page 45, line 5 as follows:

Australian Society for HIV Medicine (ASHM)-2001, Australian Antiretroviral
Guidelines, <http://www.ashm.org.au>.
